I. INTRODUCTION

Nationwide there is increasing concern with the problems of youth. Arrests of young people are soaring, and there are indications that violence, both in schools, and in the communities at large, is on the increase. In Montana, there were 2,282 felony arrests for juveniles in 1976, up from 1,023 in 1971.¹ Yet what is missing in the attempts of both individuals and agencies to deal with youth problems is a fundamental set of knowledge about the needs of all youth, not just those in trouble.

The vast majority of youth manage to avoid serious trouble and consequent identification as delinquents, behavioral problems, or one of the many other negative labels society has for kids who get into trouble. Yet, the available information on which we make judgments about youth problems is almost exclusively derived from statistics about youth in trouble, those who have come into contact with the juvenile justice system, or who have had trouble in our schools.

To understand why some youth get into trouble, and others do not, we need the answer to the question "Why, and under what conditions, do young people lead essentially law-abiding lives?" To answer this question, we must deal not just with youth who have been noticed because they do not conform to the standards of society, but with all youth. Only then can we begin to understand why, and under what conditions, young people get into trouble.

1. 1976 Annual Report, Criminal Justice Data Center, Montana Board of Crime Control, Helena, Montana, October 1977.

Towards this end, we can view adolescent youth as consumers of the services which society provides: education, recreation, employment, job training, counseling, etc. As consumers, and participants, young people have opinions, perceptions, and feelings about those services. Their input is a critical element in the development of the fundamental, baseline set of knowledge which we must have if we are to provide services which meet the needs of people growing up in American society.

In an effort to develop the baseline knowledge necessary to begin to plan effectively for young people, the Child and Youth Development Bureau, and the Montana Board of Crime Control, with the support of schools and local volunteer groups throughout the state, conducted a series of surveys to determine what young people between the ages of 11 and 17 perceive to be their problems, difficulties and needs.²

This report details the findings of the Youth Needs Survey administered to students in Grades 7 through 12 throughout the state. There are three sections in the main body of the report. Section II contains a description and history of the survey instrument used. Section III reports on the findings for planning purposes, and Section IV summarizes the findings. In addition, there are appendices which contain more detailed information, including the sampling procedures, a copy of the instrument, and a complete set of tables of the findings.

II. THE HISTORY AND DESCRIPTION OF THE SURVEY INSTRUMENT

The Youth Needs Questionnaire was developed for the Office of Youth Development, Department of Health, Education and Welfare, and has been administered in over thirty communities, both urban and rural, nationwide.

The portion of the schedule used in the Montana Surveys is a self-administered checklist of approximately sixty potential problems and needs which a young person could have (See Appendix A for complete survey). The potential problems and needs are broken down into seven areas: 1) Jobs/Employment, 2) Drugs, 3) Medical, 4) School, 5) Police and Courts, 6) Family/Neighborhood, and 7) Recreation.

III. SURVEY FINDINGS

A. Demographics

The Youth Needs Questionnaire was administered to a sample of youth attending Grades 7-12 in the public school systems of Montana. Respondents were selected by school, regionally, to assure a good cross section of youth. Probability sampling methods were not employed due to time restrictions. Table 1 describes the youth who responded to the self-administered questionnaire in terms of their age, sex, ethnicity, and

-
5. The instrument used in this survey was developed under contract to DHEW by Behavioral Research and Evaluation Corporation of Boulder, Colorado. In the preparation of this report, we have drawn from the reports submitted to DHEW by BREC, both for format and substantive interpretation of our findings. (Community Planning and Feedback Research, FY 75 (12 volumes), BREC, 1975) These excellent reports are available from the Behavioral Research and Evaluation Corporation, 2305 Canyon Blvd., Boulder, Colorado 80302

school grade (other demographic data can be found in Appendix B, page 63). Table 1 also contains information obtained from census and school enrollment figures for comparison purposes. Since discrepancies between sample data and population characteristics can effect the quality of information obtained from samples, an attempt will be made to examine potential biases.

First, it is apparent from Table 1 that the correspondence between sample and population figures, both with respect to percent male and female and the ethnic composition, is very good. There is about a one percent difference for both. There are some discrepancies, however, between the sample and the population figures for the age/grade breakdowns. There is a slight overrepresentation of youth in the 7th and 8th grades (about 5%) in the sample. 12th graders, on the other hand, are underrepresented by about 50%. These differences are born out by the figures for AGE. While there is a rough correspondence between AGE and GRADE, since the sample was selected by grade, not by age, the GRADE comparison most accurately reflects potential biases in the sample data (See Appendix C, page 71, for the sampling procedure).

Since probability sampling methods were used for both the Helena and Great Falls surveys, a secondary check on the accuracy of the findings for the State Survey can be conducted by comparing the state results

to those for the other two sites. Such a comparison has been done using the proportion YES responses and their relative ranking by substantive area (for a discussion of the differences among the surveys, see Appendix D, page 73).

B. Description and Interpretation of the Questionnaires

The core of the questionnaire is the Checklist of Youth Needs given in Table 2. For each item on the list, three responses were obtained. First was an indication (yes or no) as to whether or not the respondent had ever had that problem. For each problem or need which had occurred, a youth was asked to indicate the frequency and the seriousness, each on a three point scale, with which it occurred. Table 2 summarizes all three dimensions of each need/problem.

The first column of Table 2 gives the percent of the sample who indicated that the problem had ever occurred, and the number of students responding affirmatively to that need/problem. For example, 33.7 (570 youth) claim that the first item listed, "The only jobs available have no future," has been a problem. With regard to the frequency of the problem (If YES, how often), 30.4 said that the problem had occurred once or twice, while 31.0 said it was a problem sometimes, and 38.6 had encountered the problem very often. The last section of the table reflects how serious the respondents considered the

RECREATION									
55. Entertainment and other recreational things cost too much	56.4	960	14.6	37.7	47.7	29.7	38.9	31.4	
56. Recreation, school or community centers are not open when you want them to be or not enough different things to do	48.4	824	14.8	34.7	50.5	25.3	39.7	35.1	

problem to be. 43.8% said it was not very serious, 34.8% said it was somewhat serious, and 16.9% said it was very serious. For the frequency and seriousness portions of the table, the percentages are based on the number of respondents answering YES (in this case 570).

Looking down Table 2, the reader will notice that the items have been arranged by descending order of percentage YES answers within each of the seven (Jobs/Employment, Drugs, etc.) areas explored by the questionnaire. It is easy, using the YES column, to select which problems in each area appear to affect the most youth. To fully understand the situation, however, all three dimensions must be used. While a particular problem may occur for many youth, it may not occur very often, or be perceived to be a serious one (see Item 12, need counseling). Conversely, even though a particular problem may not affect a large number of youth, it can be a frequent and serious problem for those affected (see Item 26, need for counseling about pregnancy).

From Table 2, it appears that the most serious problem which all youth had was Item 55, entertainment and other recreational things costing too much. It was a problem for 56.4% of the respondents, and 85.4% of those for whom it was a problem, said it happened more than once or twice. 70.3% considered it to be a somewhat or very serious problem.

The second most serious problem deals with students not having any say in how schools are run (Item 32) with 53.9% responding. For those who see this as a problem, it has occurred for 81.8% more than once or twice and is considered somewhat or very serious by 75.9%.

C. Selection of Priority Items and Further Analysis

While Table 2 gives us some indication of the needs and problems which youth in the state have, the information is incomplete. To really isolate the problem so that we can understand it, we need to know the answer to a number of other questions. Is it more of a problem for males than for females, for older rather than younger youth, for young people in particular schools or neighborhoods?

To examine these problems in more detail, priority items were selected. The most frequently reported item in each of the seven areas were examined. Additionally, items of particular interest, both because of severity and programmatic implications, were selected. Finally, other items, regardless of content area where significant percentages of youth were involved, were added to the list. In all, fifteen problems/needs were chosen for additional analysis.

Table 3 shows the percent of youth indicating each of the selected needs and problems broken down

by age and sex:

JOBBS

With respect to jobs, the greatest problem is that over a third (33.7%) of the youth felt that the jobs available to them had no future. This problem was relatively greater for sixteen year olds (41.1%) but similar for all ages. Older youth considered the problem more serious. It also appears that males (35.5%) encountered the problem slightly more frequently than did females (31.9%).

A relatively high percentage of youth (33.3%) also reported that they had a problem getting jobs because of their age. The incidence of this problem decreases with age, indicating that it is a greater problem for younger teenagers. For most youth, the problem occurred infrequently and was not considered very serious.

On the other hand, those respondents who indicated that they were having trouble finding summer jobs (26.5%) encountered the problem more frequently and considered it to be relatively serious. This was particularly true of older youth, with over 65% of the 17 and 18 year olds considering it to be serious or very serious.

For those youth considering lack of training for jobs to be a problem, there is a slight age-related trend. Concern increases with age to fourteen where

the percent of youth who voiced the problem stabilizes between 27% and 30%. A larger proportion of 18 year olds (37.4%) expressed this problem. It was also the case that the percentage of males who reported this problem was slightly higher than females.

DRUGS

The most frequently mentioned problem which youth had concerning drugs was being hassled by other kids to use or buy beer or alcohol (20.6%). This finding is not surprising since virtually all studies which have been conducted on adolescent drug use have shown that the most frequently used and abused drug is alcohol. According to this survey, the problem increases with age both in terms of the percent of youth involved and the frequency with which it occurs. A high proportion of youth of all ages, however, do not perceive the problem to be a serious one. Males and females encountered the problem with equal frequency (20.5% vs 21.3%).

MEDICAL

The cost of medical treatment was a concern of 13.3% of all youth. This could reflect a general knowledge of the rising costs of medical care to the family. It is interesting to note, however, that the concern increases with the 17 and 18 year olds (18.4% and 21.9%). Both the frequency and perceived

seriousness of the problem also increase with age. Males and females are equally concerned with this problem.

SCHOOL

School related problems form a major part of all youth's concerns. While these problems should not be considered lightly, neither should they necessarily be interpreted as a blanket condemnation of the school systems. Because of the emphasis placed on education in our society, the fact that a major part of peer relations occur in the school setting and the sheer number of hours per day that youth spend in school each week, school related activities form a major part of each student's life. It is not unreasonable to expect, therefore, that adolescents will be particularly concerned with their own performance in this area.

All students, regardless of age, expressed concern that they did not have enough say in how schools were run (53.9%). They encountered this problem frequently and perceived it to be serious to very serious.

Another dimension of this problem is expressed by the respondents who stated that there are not enough kinds of classes or courses at school. More older youth express this problem with increasing frequency and consider it to be serious.

Respondents were also concerned that, in their opinion, teachers, counselor, and principals were not interested in and did not understand students (38.3%). This problem increased with age with 59.1% of eighteen year olds reporting this problem. All ages reported it as a frequent and serious problem, and more females (36.1%) encountered the problem than for males (28.9%).

POLICE/TEACHERS

Youth expressed two problems with respect to the police in their communities. First, they were concerned that police treat things more seriously than they should. The percent of youth reporting this problem increases with age, stabilizing between 25% and 27%. Older youth are more likely to have encountered the problem more than once or twice. Most youth who encounter the problem agree the age of 12 consider the problem to be serious (68.4%) to very serious (31.6%). Slightly more male respondents have encountered the problem than have females (30.1% vs. 28.9%), but females reporting the problem are more likely to have encountered it more than once or twice (35.2% vs. 25.1%).

Second, the respondents were concerned that their teachers were not interested in them. More older students encountered this problem (between 25% and 32.4%) for

students, ages 16-18). A majority of all respondents considered this to be a serious problem. Interestingly enough, there was only a slight difference in the percent of males and females reporting this problem (27.8% vs 24.9%).

FAMILY/NEIGHBORHOOD

Youth, regardless of age, reported concern with having things stolen or destroyed in their neighborhood (45.1%). Over 50% said that this had occurred more than once or twice, and considered it to be a serious problem. This problem is the third most frequent mentioned by the respondents and, as such, suggests that ways to deal with it should have a high priority.

A high proportion of youth also reported that they had a problem with parents not understanding kids (37.9%). There is a linear relationship between age and this problem, with a larger proportion of older youth indicating that this has been a problem for them. There is also an increase in frequency with which the problem occurs for older respondents. With the exception of twelve year olds, a majority of youth report that the problem is serious to very serious. A substantially larger proportion of females reported the problem than did males (43.8% vs 31.9%), and for them, the problem occurred more frequently and was more serious when it did occur.

ENTERTAINMENT AND RECREATION

Both items on the survey dealing with recreation, the cost and the unavailability of, or access to recreational facilities, were of concern to a large proportion of youth. In terms of overall concern, the cost of recreational things (56.4%) ranked first followed by recreation, school or community centers not open, and not enough things to do (48.4%) as second.

These problems occur more often for older youth and become increasingly serious as age increases. Both problems were rated as serious by all youth.

D. Regional Comparisons

There are five Planning Regions utilized by the Montana Crime Control Board and the Child and Youth Development Bureau for purposes of this survey. Region I covers the northwestern part of the state, including the cities of Missoula and Kalispell. Region II encompasses the southwestern portion of the state which contains Helena, Anaconda, Bozeman, and Butte. Region III is in the northcentral portion of the state and includes the area surrounding Great Falls, Havre, Shelby, Conrad, and Chinook. Region IV, in the southcentral part of the state includes Billings, Lewistown, Harlowtown, and Roundup.

Region V covers the eastern plains of Montana from Glasgow and Wolf Point in the north to Miles City, Glendive, and Baker to the south. These Planning Regions are portrayed in the map of Montana on the following page.

Table 4 shows the needs of youth broken out by these Planning Regions. Nine youth needs have been selected for this analysis. They represent the most frequently mentioned item in each need area. Two items from the Police and Courts area have been included since the proportion of youth reporting these problems are almost identical (26.4% vs 26.3%).

Several patterns emerge when youth needs are observed by Region. First, the reader will notice that Region III has a higher proportion of youth (when compared to the state percentages) reporting every problem (*YES column) with the exception of "being hassled by other kids to use or buy alcohol." Region IV has the highest reported percentage for this item. Furthermore, Region III youth also report the greatest frequency of incidents and consider those incidents to be more serious when they occur for the following items: "Having things stolen or destroyed in your neighborhood" and "students not having enough say in how schools are run."

On the other hand, youth in Region V (the plains) report substantially lower incidences of problems with "jobs having no future", "police being too strict", "friends being arrested", and "recreation costing too much", than do youth in other parts of the state. While the percent of youth reporting that "being hassled by other kids to use or buy alcohol" is not very different in Region V than it is in the state as a whole, youth reporting this problem in this region encounter the problem more frequently (77.2% have had the problem more than once or twice) and perceive it to be more serious (41.1% somewhat to very serious) than do youth in other parts of the state.

Region IV also has a larger proportion of youth reporting that jobs, alcohol, and the cost of recreation are problems than is the case for the rest of the state. For youth in Region IV who report that the lack of meaningful jobs is a problem, the problem is both more frequent (77% have encountered this problem more than once or twice) and serious (60.2% report it as somewhat to very serious) than is true for youth in other parts of the state.

There are no other immediately apparent patterns which distinguish the needs of youth by

region, but there are some isolated findings which might have programmatic implications when examined in greater depth.

IV. SUMMARY AND CONCLUSIONS

As was previously mentioned, the fundamental assumption behind the development of the Youth Needs Survey Questionnaire was that youth, as consumers of the services which society provides, should have the opportunity to express their perceptions of their needs. Youth needs in seven areas have been examined. Two considerations were taken into account in the definition of the areas and the selection of questions. First, theoretical models were examined to determine major factors which influence the development of youth into productive adults. Second, strategies for potential intervention to improve services in the seven areas were kept in mind. Thus, the findings should not only be "interesting" with regard to what they tell us about the problems of youth, but should also have programmatic implications for improving services to youth.

It is difficult, if not impossible, in a summary report to consider all the data and to make relevant suggestions which could apply to individual communities. Each community, in essence, is not in the mix of agencies which deal with such areas as labor, recreation, education, and the family, then in the

composition, funding and intent of those agencies. Additionally, not all resources for the solution of the problems are in the public arena. Private recreation facilities are an example of important resources which are not in the public sector, but which can play an important part in the delivery of services to youth.

Furthermore, the perceived needs of youth are only a part of the answer to improved services. The needs of other groups in the community must also be met, and there is competition for scarce resources.

Other important groups have perceptions of what they want young people to learn and do, and their impressions of youth needs must also be considered. There are also real limitations to what institutions in communities can do, and these must also be considered. Schools, for instance, cannot assume parental responsibilities for education just as the police cannot replace parental supervision and direction. All of these factors must be considered in the planning and delivery of services to youth.

What the Youth Needs Survey does provide, for the first time, however, is input in a systematic way from youth themselves. Their perceptions of their needs can be used as a starting point to ask and attempt to answer more specific questions, and to plan better services.

Many youth expressed the desire for meaningful work experiences. Their concerns centered around access to career-oriented jobs with requisite training. They see their age as a stumbling block in obtaining such work experience. Youth were also specifically concerned with finding summer employment. These concerns collectively seem to reflect adolescents' desire to obtain experience in an area which will become increasingly important for them as they assume adult status. Although it is often difficult to find good jobs and to design training for future jobs for youth, it would seem that ways should be explored to meet these needs.

Our findings support the position that, by far, the most prevalent and potentially harmful drug in widespread use in society today is alcohol. While the majority of youth do not perceive its use to be problematic, it will continue to be a problem for a certain proportion of the population. The earlier this problem can be identified, and programs developed to deal with it, the more likely that potential alcoholics can be helped to lead useful lives.

While the cost of medical care is not a concern for most youth, it appears to be a serious concern for those youth who have the problem. Ways should be sought to facilitate access to low cost medical care for adolescents, and to publicize those alternatives which are available, perhaps through hygiene

courses in the schools. Both the ability to develop resources and the access to existing resources will vary from community to community, and local solutions must be developed.

It is not surprising that a large number of concerns which youth have involve school related matters. Because the school setting accounts for one of the single largest portions of an adolescent's life, both with respect to the importance placed on education by society and the sheer number of hours per week youth spend in school, we should expect school related concerns to be prominent.

Respondents indicated that their concerns centered around lack of involvement in decisions about their school lives in general, the rigidity and constraint in existing curriculums, and the general lack of understanding or interest in them on the part of school personnel. Much of this frustration is endemic to the situation. In passing from childhood to adult status, adolescents must be able to "try on" adult roles, make decisions for themselves, and achieve a sense of autonomy. At the same time, schools are given the responsibility for educating youth and must make many unpopular decisions in that process. The fact that there are inherent conflicts in the school setting should not be used as an excuse to do nothing, however, every

opportunity should be explored to maximize the potential for student input and participation within the constraints of the mandate given to schools by the community.

It appears from the findings that many of the encounters which youth have with the police produce antagonism. Since police procedures vary from community to community, and even from officer to officer, it is difficult to interpret what exactly is going on. Once again, however, it is often the case that the police are given responsibility for issues which the wider community is not willing to deal with such as vandalism. While in some cases individual officers, and even whole departments, are partially responsible for the negative opinions which many adolescents have of them, the problem is partially due to the isolation of the police as agents of control, and the unwillingness of the rest of the community to assume their share of the responsibility for dealing with problems. Positive encounters with police officers, and a better understanding of the issues would help this situation. In some communities, it might be discovered that certain police procedures should be changed. Tackling this problem, the concerned person should also be aware that many

of the procedures result from related procedures in other portions of the juvenile justice system, particularly in the courts, Probation and Parole Departments, and detention facilities. An understanding of this system as a whole is critical to finding any solution to a problem in a particular part.

Parent-adolescent relationships also proved problematic for a substantial proportion of the youth interviewed. Lack of understanding on the part of parents was a problem for many youth and was a greater problem for the older adolescents in the sample. Without exploring this relationship in greater depth, it is difficult to say how this finding should be interpreted. To a certain extent, a "generation gap" exists between parents and child, and this universal characteristic of American society is bound to be more pronounced as adolescents mature, assuming more responsibility for their own lives. On the other hand, there is evidence that lack of parental support, and a cohesive primary family unit, in combination with other variables, can lead to severe problems for youth. Intervention into the family structure is an extremely sensitive issue, but counseling for individuals and families should be provided for those who wish it. Some persons have also

advocated increased parental involvement in activities and issues which involve their children, such as sports, school activities (PTA), and recreation.

Neighborhood, in the sense of belonging to a community and sharing values with other persons, can also be extremely important to youth. Over 45% of the youth surveyed indicated that they were having trouble with things being stolen or destroyed in their neighborhoods. While this is a problem, the response is encouraging. It indicates that there is an interest in the part of youth in maintaining a living environment which is supportive rather than one which is conducive to vandalism and theft. This normative response should be encouraged and tapped to explore ways in which neighborhood vandalism and theft could be reduced.

Youth across the state uniformly reported that they were both concerned with the cost and availability of recreational things to do in their leisure time. This finding should have immediate programmatic implications for every community in the state. Options will vary from community to community but it is clear that leisure needs are of critical importance to youth, and should have one of the highest priorities in planning for youth.

Finally, we can see from the regional comparison that youth concerns are remarkably similar across

the state. Some regions have different patterns of responses, and Region III, in particular, has a higher proportion of youth reporting problems than other regions, but the problems/needs are there in every region.

To understand these problems and their potential solutions, the unique characteristics of various communities should be explored. Additionally, those areas which have a particularly low percentage of youth reporting problems should be examined to determine if there are particular actions which have been taken in those areas to reduce problems which could be applied to other communities.

APPENDIX A
SURVEY QUESTIONNAIRE

MONTANA YOUTH DEVELOPMENT BUREAU GENERAL SURVEY

The results of this survey will be used for planning youth needs and services. Please do not put your name on the questionnaire. If you do not understand a question, please leave it blank and go on.

-
1. How old are you? (circle one) 11 12 13 14 15 16 17 18 19
 2. What is your sex? (check one) ___(1) Male ___(2) Female
 3. To what ethnic group do you belong? ___(1) White ___(2) American Indian
___(3) Chicano ___(4) Black
___(5) Other (specify) _____
 4. What grade are you in now? ___(1) 7th ___(4) 10th
___(2) 8th ___(5) 11th
___(3) 9th ___(6) 12th
 5. How long have you lived in your present neighborhood?
___(1) Less than one year ___(3) 3 or 4 years
___(2) 1 or 2 years ___(4) More than 4 years
 6. Which of the following best describes the structure you live in?
___(1) House ___(2) Apartment ___(3) Mobile or trailer home
 7. Which of the following best describes where you live?
___(1) In a city or large town ___(3) In a small town or the country
___(2) In suburb of a city
 8. Is the head of your family:
___(1) Your brother or sister ___(4) One of your grandparents
___(2) Your father or "father figure" ___(5) Someone else (specify) _____
___(3) Your mother or "mother figure" _____
 9. What is the occupation of the head of your household?
___(1) Housewife ___(6) Student
___(2) Agriculture ___(7) Professional or Technical
___(3) Business ___(8) Government
___(4) Retired ___(9) Labor
___(5) Unemployed ___(10) Other (specify) _____

10. How far did the head of your family go in school? (Check the highest level of education completed)

___(1) Grade school only

___(2) Some High School

___(3) High School graduate

___(4) Some college or vo-tech school

___(5) 4 year college graduate

___(6) Post-graduate or professional training
(M.A., Ph.D., etc.)

11. Counting yourself, how many persons under 18 live in your home? _____

In this section, we would like to find out something about the kinds of needs and problems you have. It is not likely that you will have had all of the problems or needs listed. If you have NOT had that problem or need, circle 2 under No in the first column and go on to the next question. If you have had that problem or need, we would like to know How Often and How Serious it is for you personally.

Please circle the appropriate response for each of your answers.

Problem or Need	Has this ever been a problem for you personally?		If YES, How Often?		How Serious?			
	YES	NO	Once or Twice	Some- times	Very Often	Not Serious	Somewhat Serious	Very Serious
12. Need counseling about job and finding a job.	(1)	(2)	(1)	(2)	(3)	(1)	(2)	(3)

APPENDIX C
SAMPLING PROCEDURE

Due to time constraints, and the desire to conduct the survey in the 1967-77 school year, probability sampling methods were not used for the State Survey of Youth Needs. Every attempt was made, however, to approximate, as closely as possible, a probability method.

First, the junior and senior high schools in the state were divided into the five Planning Regions (see map, page 38). Next, schools were selected from each planning region using the following criteria: 1) best geographical distribution in the region, 2) best demographic distribution in each region, 3) correct proportion (by population) of junior to senior high schools. Since surveys in Great Falls and Helena had already been conducted, schools in those cities were not selected. Cases were selected systematically for inclusion into the state sample from those sites in the correct proportions.

Instructions were sent, with questionnaires, to selected schools and administrators were asked to select classrooms on the following criteria: From a list of required classes (e.g., English classes) for each grade in the school, select classes randomly. The exact number of classes per school was based on a percentage figure to yield approximately 2,100 interviews for the entire state.

Although this design does not yield a probability sample, it approximates a stratified cluster sample design. A total of 1,777 questionnaires were coded and punched on computer cards for a completion rate of approximately 84%.

APPENDIX D
COMPARISONS OF STATE DATA TO HELENA
AND GREAT FALLS DATA AND SELECTED
NATIONAL SITES

The data in this Appendix explores the possible biases introduced in the sampling procedure. This is done by comparing the substantive findings for all three surveys conducted to date in Montana (the state, Helena, and Great Falls). Table 6 contains the percent YES responses for all three surveys and the relative rank of these responses by problem area (Jobs, Drugs, Medical, etc.). The responses for Montana can also be compared to findings for Portland, Oregon; Portsmouth, New Hampshire, and Churchill County, Nevada (last three columns, Table 6).

For the most part, there are no major differences among the findings from the three surveys. With respect to "Jobs", however, there are differences which could reflect sampling biases (see Table 6, this Appendix). Great Falls was the only site where the correct proportion of seniors (grade 12 or 18 year olds) was obtained (due to the timing of the surveys for the state, and in Helena, a large proportion of seniors were lost because of graduation related activities). In Great Falls, lack of specific job training (37.9%) was the second most frequent problem. It was also more of a concern of older youth. This could lead to the assumption that, had the seniors in both Helena and the state, as a whole, who were missed, been included, this item might have been higher in the ranking. The reader should be cautioned, however, that the same difference could be explained by real differences in the perceived problems of youth in the different sites.
